Zora Play demo video: what to record and what to say

About 2 min 50 s (the limit is 3:00). Record the picture first, then read the voiceover while watching it. The "Until" time is where each scene should end in the finished video.

#	Until	Screen to record	Voiceover (read this)
1	**0:08**	The stick and remote on the table, then Settings → My Fire TV → About, then the app launching	**"This is Zora Play, a TV buddy for children aged three to eight, on a real Fire TV Stick. No account, no ads, and it works offline."**
2	**0:20**	The opening scene with the four buddies, then the Home screen	**"Four buddies: Zora, Mimi, Bruno and Teddy, each with its own look and voice. On this entry-level stick they are light 2D characters; stronger devices show them in 3D."**
3	**0:30**	Home tiles, then **My buddy**: pick Mimi, hear her introduce herself, pick Zora again	**"Everything is driven by the remote. Pick a buddy and it introduces itself."**
4	**0:48**	**Dance Studio**: Wiggle, Faster twice, Stop. Then **Dance Maker**: add Wave, Jump, Turn Around, Hands Up, press Go	**"Faster really speeds up the dance and the music, and stop is instant. In Dance Maker, children pick four moves and watch their own dance."**
5	**1:08**	**Rhyme Room**: play Dragon Tap with the lyrics highlighting, the buddy clapping and reaching, and Zora's flying loop	**"In the Rhyme Room, songs play with word highlighting, and the buddy acts out the lyrics: clapping, reaching, swaying. Every few lines it does its own special move. Zora flies a loop."**
6	**1:20**	**Band**: press Piano, Drum, Guitar, Trumpet, Maracas	**"In the Band, every instrument has its own sound, and its own way of being played."**
7	**1:32**	**Talk**: "Tell me a joke", then "I'm sad"	**"Talk uses fixed, reviewed, voiced lines: an easy joke, and a gentle answer when a child is sad."**
8	**1:44**	**Play**: Zora Says (the spin), Animal Sounds and a shiny scale. Then 2 seconds each of Alphabets and Calm breaths	**"Games are short and forgiving, and winning earns a shiny scale. There is also an alphabet tune and calm breathing."**
9	**2:03**	**On the Mac:** the TV Audio Flow repo (license, README) and `npm run check` passing. **On the TV:** play a rhyme and press Back, and it stops at once	**"For the Open Source challenge we published TV Audio Flow, an MIT library for TV apps. Only one sound sequence plays at a time, and Back cancels it instantly. It has tests, examples and a README, and it drives the Rhyme Room."**

10	2:28	**On the Mac:** `npm run bedrock:check` (unsafe line blocked), the safety report, `npm run bedrock:review`, CloudWatch with the account id blurred. **On the TV:** the buddy says an approved line	**"For AWS Builder, Amazon Bedrock writes new lines at build time only. A Bedrock Guardrail checks every line, a person approves each one, and CloudWatch logs every call. Forty-five lines were generated, twenty-eight approved. The TV never calls AWS."**
11	2:46	**Settings**: hold OK for 3 seconds to show the privacy panel. Optionally 2 seconds of Wi-Fi off with the app still running. Then Back twice, and wait for "Bye bye! See you soon!"	**"No account, no ads, nothing saved, and no internet needed. Zora Play: talk, play, dance, learn."**
12	2:50	**End card (text only):** repo links, plus "Songs made with Suno (paid plan), lyrics written with ChatGPT. Built with AI assistance. Amazon Bedrock used at build time only."	*No voiceover.*

Tips

- Record each scene as its own clip, with a few extra seconds before and after, so you can trim to the times above.
- Do not show the Fire TV Home screen (other companies' logos). Launch the app with `adb shell am start -n com.zoraplay.firetv/com.miloplay.tvbuddy.firetv.MainActivity`.
- Do not talk over the buddy's own voice or the songs. Pause your voiceover while they play.
- The voiceover is about 330 words. Read it slowly, and trim words if a scene runs long.
- Blur the AWS account id and any key or profile name. No personal data on screen.
- No other music, and keep third-party logos out of every shot.

The TV Audio Flow repo link for the end card still has to be added once that library is in its own public repo.
